Teaching Videos

List each teaching video you watched. For each one, write a real takeaway. What concept clicked for you? What surprised you or challenged an assumption you had? What impressed you about how your teammate demonstrated something? Take this seriously. Your teammates put real effort into these videos to teach you something you did not study yourself.

Video

I watched Esther's video on color-scheme Deep Dive.

Takeaway

One thing that really stood out to me was how much the color-scheme property changes automatically. Before watching the video, I assumed supporting dark mode required writing custom styles for every form control and browser interface element. I learned that simply setting color-scheme allows the browser to automatically update scrollbars, form controls, and system colors to match the user's preferred theme.

I also thought the explanation of the `<meta name="color-scheme">` tag was helpful. I didn't realize it helps prevent the white flash that can happen before the page's CSS finishes loading in dark mode. That was something I had never considered before.

The live demonstration of switching between light mode, dark mode, and following the operating system made the concept much easier to understand. I also appreciated the comparison between Chrome and Firefox because it showed that native controls are rendered differently in each browser, reinforcing the importance of testing across multiple browsers. This connects well with my own work because I recently added theme support to my practice site, and the video helped me better understand how browsers handle native UI elements automatically when color-scheme is configured correctly.

Code Reviews

Review at least two teammates' Practice Site repositories. Look at their actual code for Choose Topic pages you did not build yourself. Each design review you should choose different teammates to review so that over the course of the semester you cycle through everyone on your team.

Review

I reviewed Harrison Merrill's code for their Interpolate size page.

What You Found

I reviewed Harrison Merrill's code for his interpolate-size demo. One thing I noticed that the video did not fully show was how much written explanation he included directly on the page. The demo does not just show the effect; it explains why animating from a fixed height to auto used to be difficult, why max-height was an imperfect workaround, and how interpolate-size: allow-keywords solves that problem.

I thought the strongest part was that he included both a correct pattern and an intentionally broken example. The broken example helped show why overflow: hidden matters during the transition. I also liked that he included a prefers-reduced-motion block, because that showed he was thinking about accessibility and not just the visual effect.

I did notice a few small writing issues, like "treatt" and "ect.", but I did not see anything major that broke the page. I would probably mention those small typos, but overall the structure was clear and useful. The part I would want to learn from is how he explains the old workaround, the new property, and browser support all in one flow.

Check In

How Are You Doing?

I am doing well! I have been on vacation for the last week and the next week as well. And as far as reviewing others' sites, I have only been able to find a few. They're not necessarily my group, but it's who I could find on Github. As I am submitting this assignment, I could also only find 1 other person who had a posted and published site I could see with up to date demos. Other than that I am well.
