Topic and Video

I chose to study and teach about: **Variable Fonts**. I have uploaded my video to YouTube and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: <https://youtu.be/7u66x4F1v68>.

Summary

In my video, I explained what variable fonts are and how they allow multiple font weights and styles to be contained in a single font file instead of requiring separate files. I discussed the benefits of variable fonts, including greater design flexibility and the potential to reduce the number of font files a website needs to load. I demonstrated a simple webpage with a slider that visually changes the typography and a hover animation to show how font properties can be animated with CSS. While recording, I realized I should have spent a little more time explaining the different variable font axes, such as weight and width, and the difference between loading a variable font with `@font-face` versus using a service like Google Fonts. Even with the simplified demo, the main goal was to show how variable fonts provide more control over typography and can create smoother, more flexible text styling.
