Topic and Video

I chose to study and teach about: **Relative Color Syntax**. I have uploaded my video to **YouTube** and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: <https://youtu.be/7QiS7wHLrjM>.

Summary

The video covers CSS relative color syntax and how it can be used to build a flexible color system from one seed color. I explained how the `from` keyword works by taking an existing color, breaking it into channels, and letting me reuse or modify those channels. In the demo, I used `oklch()` because it separates color into lightness, chroma, and hue, which makes each adjustment easier to understand.

I demonstrated how changing only the lightness channel can create lighter and darker versions of the same color while keeping the original hue and chroma. I also showed how changing chroma can make a color more muted or completely gray, and how shifting hue can create complementary or neighboring colors on the color wheel.

The main part of the video was building a palette ramp with values like `accent-100`, `accent-300`, `accent-500`, `accent-700`, and `accent-900`. Each color was derived from the same `--seed` value. When I changed only the seed color, the entire palette updated automatically, which showed the main benefit of relative color syntax.

I also compared relative color syntax with `color-mix()`. `color-mix()` is useful for simple tints and shades, but relative color syntax gives more precise control over individual color channels. After recording, I realized I could have spent more time explaining browser support and when to choose `color-mix()` instead of relative color syntax in real projects.
