Topic and Video

I chose to study and teach about: **Blend Modes**. I have uploaded my video to **YouTube** and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: https://youtu.be/IL_omNbYj_U.

Summary

This video covers CSS blend modes and how they can be used to create unique visual effects by controlling how colors and layers interact with one another. I explained the difference between blending content with the background and blending multiple elements together, showing how blend modes can change the appearance of text, images, and colored overlays without editing the original graphics.

Throughout the demonstration, I explored several common blend mode values and showed how each one produces different results depending on the colors and elements being combined. I also demonstrated practical uses for blend modes, such as creating more dynamic backgrounds, improving visual interest in layouts, and adding creative effects to images and typography. The examples highlighted how blend modes can be applied directly in CSS, making it easy to experiment with different visual styles while keeping the code relatively simple.

One important thing I realized after recording is that I could have spent more time discussing accessibility and readability. While blend modes can create interesting effects, some combinations can reduce text contrast and make content difficult to read. If I were to record the video again, I would also include additional real-world design examples and explain when blend modes are most appropriate in a production website versus when they should be used primarily for decorative purposes.
