Topic and Video

I chose to study and teach about: **Styling SVG with CSS**. I have uploaded my video to **YouTube** and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: <https://youtu.be/jWSRGZUipC8>.

Summary

This video introduces the basics of styling inline SVG graphics with CSS. It explains what SVGs are, why they scale without losing quality, and why inline SVGs are more flexible than SVG files loaded with an `<img>` element. The demonstration covers styling SVGs with the `fill` and `stroke` properties, using CSS custom properties for consistent colors, and applying `currentColor` so icons automatically match surrounding text. It also shows how to target individual SVG elements with classes, create hover effects using CSS transitions and transforms, and add accessible markup with titles, descriptions, and appropriate ARIA attributes. The demo concludes by comparing inline SVGs to external SVG images to highlight when each approach is most appropriate.

After recording, I realized I could have spent more time explaining how SVG elements like `<path>`, `<circle>`, and `<g>` are similar to HTML elements because they can each be selected and styled independently with CSS. I also would have demonstrated how browser developer tools can be used to inspect SVG elements and experiment with different styles in real time, which can make learning and debugging much easier.
