Topic and Video

I chose to study and teach about: **BYU–Idaho WDD 331R • Advanced CSS Menu Toggle site search Color scheme Unit 1 Unit 2 Unit 3 Unit 4 Unit 5 Unit 6 Unit 7 Animation Choreography and Custom Easing**. I have uploaded my video to YouTube and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: <https://youtu.be/BZbZxZoolbw>.

Summary

This video explains how animation choreography and custom easing can make a web interface feel more polished and intentional. I demonstrated how to create staggered entrance animations using the `--index` custom property pattern and `calc()` so each card appears in sequence without needing separate `:nth-child()` rules. I also covered why `animation-fill-mode: both` is important for staggered animations, preventing elements from briefly appearing before their animation begins.

I showed how custom `cubic-bezier()` easing curves give animations more personality than the standard easing keywords, and I used them to create smoother card entrances and a subtle pulsing animation for the live status badge. In addition, I demonstrated explicit CSS transitions for navigation links, buttons, cards, and links, explaining why listing individual transition properties is better than using `transition: all`. Finally, I discussed accessibility by implementing `prefers-reduced-motion` so users who prefer less motion still receive clear visual feedback without continuous animations.

After recording, I realized I could have spent a little more time comparing the staggered entrance to having all the cards appear at once. Showing that before-and-after comparison more clearly would better demonstrate how animation choreography improves the overall feel of an interface. I also would have briefly explored additional custom easing curves to show how different curves can create different personalities for animations.
